21 PILLARS OF NOUVEAU RATIONALISM

"When an anti-job creation syndrome visibly destroys over 100 free economies, the entrepreneurial mysticism challenges economic intellectualism and offers the
"21 Pillars of Nouveau Rationalism"
to awaken new economic thinking harmonized with entrepreneurialism."

Notice:

This is not an economic study. It is an entrepreneurial blueprint—a manifesto, bold and packed with immediately deployable, proven solutions. While the silence of economic intellectualism persists, entrepreneurial mysticism aims to ensure corrective measures are applied, allowing global economies to return to improved, progressive trajectories. This is not a distant problem. It is happening now in over 100 free economies, and it is time to act.

The rise of economic intellectualism began over a century ago, coinciding with the age of entrepreneurialism led by the United States. It was the transformative power of entrepreneurial mysticism that provided endless content to create theorems. While the West, as "knowledge-rich nations," continued to lose its dominance, "population-rich nations," notably China, continued to rise in prominence. But how and why? The quiet parade of grand failures of economic intellectualism is where the open challenge of entrepreneurial mysticism has now ignited, inviting articulation from silenced economic leadership.

Fact: It was entrepreneurial mysticism that created and drove the agro-industrial revolutions and gave rise to Silicon Valley. This was not just an economic study project. The entrepreneurial mindsets that emerged from garages, holding wires, and buttons not only invented IT but proved how it acquired billions of dollars in value and changed the face of the world—a testament to global entrepreneurial innovation.

Entrepreneurialism spearheaded the eventual merger of Western nations with far-fetched, unimaginable techno-advancements, transforming the language of commerce and global economic behavior. The internet, a gift from the United States, uplifted more than half of the global population, and e-commerce become a primary driving force of the global economy.

Over the past couple of centuries, globally, approximately one million entrepreneurs have started small enterprises that grew into giants of their time, each creating a million jobs and positively impacting grassroots prosperity. Now, let us find a Nobel Prize winner in Economics among that list.

The Imbecilians of the Order of Debt:

The Big Picture: Imagine a world where commerce grants each entrepreneur access to an unlimited currency-printing machine to expand. Imagine a dark, debt-ridden, and dying business model being practiced by all others, where debt limits are used as real collateral to prop up the national economy, and towering debt is seen as a symbol of success. Neither any sustainable enterprise nor an economy will survive under such a model. Entrepreneurial mysticism has a fundamental fiscal philosophy spanning millennia, in which productivity, performance, and profitability create real value and a solid foundation for commerce.

Economic intellectualism, however, is more about games of theorems, charting bends and twists to manipulate value, which now often leads to debt-ridden, dying economies. Currently, economic intellectualism is confused and struggling to avoid being perceived as outdated thought.

Systematic Destruction: When an anti-job-creation syndrome destroyed over 100 free economies, the games of theorems crashed. Yet, it continued to create dark, debt-ridden, and dying economies with no answers to $313 trillion in debt, no new ideas, or timely strategies. It now appears to be a public liability in a broken socio-economic and political system.

The 4B Factor: There are some four billion workers, a billion displaced due to the pandemic, a billion replaced due to automation, a billion misplaced due to improper job titles, and now a billion on starvation watch due to collapsing economies. How long can one fool oneself, the nation, and all citizens all the time? How high will the towers of debt rise? How deep will the state dig holes to preserve its lingering incompetence?

Replication of China's Economy Decades ago, when the West held most of the power, China was largely unknown. If economic theorems had balanced entrepreneurial mysticism with policies that mobilized national entrepreneurialism, the academic mindsets of the West would have created a dozen Chinas by now.

Entrepreneurial mysticism has now split the atom of economic intellectualism.

The Deep Sanctum of Mindsets: Once, humankind had only hunters and gatherers—let historians decide who risked more. Barter, trade, and tax-paying enterprises emerged. Facts remain as the world changes every century, civilization every few, and the mind every millennium. Over decades, our world of commerce today has been primarily divided into job-seeker mindsets and job-creator mindsets, and this split has led to a tectonic economic disconnection over the last century.

Nouveau Rationalism:

The 21 Pillars of Nouveau Rationalism

Introduce key factors to realign economic thinking in response to the lingering declines of over 100 free economies. They are not just a set of ideas but a transformative force that can reshape our economic landscapes. The pillars outline realities, facts, and pragmatic solutions—a revolutionary vision and a promise of a brighter tomorrow.

Overall, this rebellion against the silent defeat of economic theorems champions entrepreneurial mysticism, unleashing SME growth and offering a beacon of hope in a world shackled by debt.

Expothon narratives, and writings with over a decade of outreach to more than 2,000 Cabinet members across 100 nations confront lingering economic thinking trapped in job-seeker mindsets. Now, we move to the tactical battlefields.

The Legends of Numerical Intellectualism:

The nobility of numerical intellectualism, fueling millennia of computational triumphs, commands enduring respect. Yet, its economic legacy—$313 trillion in global debt, per World Bank data—exposes a catastrophic failure, shackling prosperity to academic dogma.

Index:

Pillar 01:
Forbidden Economic Facts

Critiques economic intellectualism's failures, exposing debt addiction and the job seeker mindset as barriers to prosperity, highlighting systemic flaws in modern economic models.

Overview:

Limits of Economic Intellectualism: The anti-job creation syndrome: how job-seeker mindsets are collapsing free economies. Economic development without entrepreneurialism is economic destruction. Hence, there is no political power without economic power, and there is no economic power without entrepreneurialism.

A brief examination of the last 100 earth shattering entrepreneurial adventures that have transformed the world, both in recent times and throughout previous centuries, will clarify this. The ultimate rotundas of free Capitols and their political powers, which slip and slide on orchestrated tunes and tangos influenced by economic intellectualism within deep, economic-controlled corridors, have visibly failed to address several key facts of basic economic growth.

The 99% Factor: The job-seeker mindset, which craves primarily job stability over risk, has stifled the entrepreneurial spirit, collapsing free economies into cycles of dependency and decline. Almost 99% of frontline economic development teams have a job-seeker mindset, as evident across more than 100 free economies, as reflected in LinkedIn profiles.

This anti-job creation syndrome is the architect of an economic catastrophe in free economies, hollowing out their foundation.

Facts:

Entrepreneurial Alternative: There Is No Chicken Farm: New job creation needs growth and the constant addition of new enterprises. Enterprises are not hatched like in some chicken farms. Entrepreneurs, and only entrepreneurs, create and grow enterprises. Some remain small, and some transform into Godzilla-sized global giants, and this is how jobs are created. There is no other way.

Notice: It takes a single day to test, audit, and verify this anti-job creation syndrome across economic development departments within any nation.

Economic Missteps: Already broken economies are stuck with Machiavellian manipulations or Nobel Prize-sized economic theorems; all they need is a calculator in one hand and a chainsaw in the other, along with common sense and a national mandate for mobilizing entrepreneurial protocols.

Realities:

A Global Divide of Two Mindsets: Since the last millennium, trade and commerce have revealed two distinct mindsets globally. The job-seeker mindset is characterized by individuals who prioritize job stability and seek support from established enterprises. Economic intellectualism is “explicit knowledge.” Explicit knowledge, such as accounting, law, or chemistry, is typically taught through books. On the other hand, the job-creator mindset is embodied by entrepreneurial risk-takers who conceive original ideas and build enterprises from the ground up. Hence, entrepreneurial mysticism is akin to “tacit knowledge,” such as riding a bike or swimming, which cannot be written or learned without direct experience. When both mindsets are engaged in balance, they create magical results.

Barriers to Entrepreneurialism: Conversely, entrepreneurial mysticism can provide pragmatic solutions to demonstrate the profound damage caused by economic thinking over the decades. It is the visible fear on the part of economic media to dabble in such job-creator mindsets and tackle AI-centric and new global-age alpha dreamers. This type of thinking hinders the unlimited growth of small and medium-sized enterprises (SMEs). It prevents the creation of a national mobilization of entrepreneurship, thereby limiting the long-term national supply of new businesses and the continuous development of large enterprises.

Solutions:

Urgency: Transforming theories into practical job growth strategies requires a significant shift in economic development training and orientation. Our immediate, action-oriented advisory aims to blend economic theory with entrepreneurial principles. We are ready to train over 20–200 national teams to gain a sharp understanding of programs focused on mobilizing small and medium-sized enterprises within 100 days. It allows for controlled growth through national mobilization strategies.

Mastery: Our objective is to strengthen existing economic foundations by integrating entrepreneurial insights to guide senior economists in fostering SME growth. We are ready to train 50–500 frontline staff on economic development and entrepreneurial mindset over a period of 100 days. By addressing mindset divides, we empower leaders to drive innovation and ensure sustainable prosperity in competitive global markets. We also provide orientations to align stakeholders for long-term success.

Pillar 02:
The Anti-Job Creation Syndrome

Highlights the job-seeker mindset as a contributing factor to economic stagnation, linking debt-driven crises to limited entrepreneurial initiative and insufficient efforts to create jobs.

Overview:

Global Job Demand: So, suddenly, why do we need a billion new jobs in the world by 2030? International Monetary Fund (IMF) First Deputy Managing Director Gita Gopinath, in an interview with The Indian Express, stated that India needs to create between 60 and 148 million additional jobs by 2030. According to Gopinath, the country should aim to produce 10–24 million jobs annually. If India alone needs this many new jobs, what will other big or small countries need? Will a combined billion new jobs be sufficient?

Failure of Rigid Models: Academia has failed over centuries to replicate this model. From the start, entrepreneurialism defies convention. There are no set procedures, no identical approaches, or repeated patterns. Like no two people among the 8 billion have identical fingerprints, hundreds of millions of SMEs worldwide started on their unique footprints, backgrounds, drives, and visions, each singing a different tune and building a unique nest. This lack of identical procedures, symmetrical expansion, or patterned and predictable stages makes each unique and different.

Hence, government agencies and economic models that foster economic development in entrepreneurial SME growth often fail in the world's free economies because, despite their qualifications, they are locked into different mindsets and are too focused on fixed and repetitive procedural progress, predictable behavior, and systemic routines.

Facts:

Entrepreneurial Dynamism: But wait, science is a science, therefore an intellectual indulgence, but not a hatchery to raise a billion chicks in poultry farms. This is a call to humankind for the world's entrepreneurs to apply their wild mysticism and keep global economic growth at a stable rate. Entrepreneurialism is primarily a dance in the sandbox, about chasing a vision, always without justification or accepted rationale. This casual and risky pattern, spanning millennia, has been repeatedly proven in recorded history. Seeing far beyond is a natural aptitude, akin to a bird's-eye view in search of a needle in a haystack or looking for a star in vast, open skies.

Skills of Tomorrow: Repeatedly, nations have failed to forge "Entrepreneurial Nations," yet they excel at producing disciplined armies with professional hierarchies and superior performance. The difference lies in training: soldiers dig trenches overnight and endure harsh conditions, not merely play acting with water pistols or drawing pictures of tanks in classrooms. Similarly, effective economic development demands well-trained teams—tested, audited, and entrepreneurial in mindset—not job-seeker mentalities masquerading as job creators. The disconnect is profound.

Asking bureaucratic teams to spark job creation is like asking sumo wrestlers to pirouette in Swan Lake. Western economies have squandered decades while China and India minted 500 million entrepreneurs through mandated national mobilization. The proven model exists; the will to adopt it does not.

Realities:

Bureaucratic Misstep: Government bureaucracies of the time and place often laughed and joked about great entrepreneurs in the making for being undisciplined risk-takers and chasing rainbows, unaware of how such wild goose chasers would ultimately create grand economic engines.

Why the lingering mistakes? Economic development without entrepreneurialism is only economic destruction. Any political power without economic power is no power. Any economic power without entrepreneurial power is no growth. Any entrepreneurial power without a balanced mindset hypothesis is no power.

Solutions:

Urgency: We offer practical strategies to generate a high volume of jobs through entrepreneurship. Our goal is to train between 100 and 1,000 officials to mobilize entrepreneurial activities and expand the small and medium-sized enterprise (SME) sector within 100 days. We also guide how to apply for various options. Our programs aim to counter job-seeker stagnation by launching billion-job initiatives through bold entrepreneurial actions. Our presentations can engage 100 to 1,000 participants, offering strategies for navigating the competitive landscape of the global economy. With a clear vision, we can achieve controlled growth in job outcomes through national mobilization efforts.

Mastery: Our small and large group presentations and workshops can reorient economists with the knowledge to achieve massive job growth targets through SME growth and provide advice on entrepreneurial principles. We aim to cultivate job-creating mindsets, enabling nations to harness the untapped potential of SMEs for global economic stability and growth. Additionally, we offer orientations to align stakeholders toward long-term prosperity. Our focus is on mastering global job creation and maintaining long-term economic stability.

Pillar 03:
Splitting the Atom of Economic Foundation

Offers a framework for the job-seeker versus job-creator divide, addressing debt-driven economic failures through a mindset shift critical for sustainable prosperity.

Overview:

Divided Mindsets: Around the world, seeking public approval for economic progress feels like a competitive event in a circus. While opinions on this matter are divided, they are not equally balanced. Economic progress is often disconnected and has essentially stalled. Over 100 free economies are desperately searching for solutions. Hungry lions are on the prowl. In this context, we need gladiators to step forward. If the economy is the number one issue, then productivity is the most critical factor to address. Productivity suffers due to a noticeable lack of entrepreneurial spirit. Performance drives productivity, and in turn, productivity drives profitability

Potential for Transformation: At times, AI may replace an organization's operations by sitting and silently blinking in one corner, occupying only 1% of the space and eliminating 99% of the operational headaches that plague thousands of workers in buildings across the globe. What special skills are needed, and what types and levels of transformative orientations and training are required to create new occupational harmony? However, this divide presents a hidden opportunity: the immense potential of AI to revolutionize the roles of a billion senior and junior management professionals. By delegating routine tasks to AI, these professionals can redirect their focus toward deep creative, critical, and entrepreneurial thinking.

Facts:

Entrepreneurial Necessity: Entrepreneurialism drives productivity, performance, profitability, and, ultimately, economic growth. Throughout history, all superpower economies have been built on these principles. Consider a significant transformation: Senior management acts as a processor of multi-layered complexity within an organization. In the world of commerce, there are two types of knowledge. The first is "explicit" knowledge, which is documented and can easily be recorded and shared. This type of knowledge underpins bureaucratic environments, where complexities can be managed through formal structures and practices, such as bookkeeping, chemistry, or law. In these settings, once information is written, it can be revised, clarified, practiced, or memorized for future reference.In contrast, in an entrepreneurial setting, where rules are flexible and business plans are minimal, the knowledge is primarily "tacit." This type of knowledge cannot be easily documented; it encompasses skills and experiences that are learned through practice, such as swimming or riding a bike.

AI's Impact on Explicit Knowledge: AI is poised to consume nearly all the explicit knowledge-based jobs already in use across 100 free economies worldwide. Today, top senior management jobs are fast food to AI soon. This could represent snatching all work from 90% of the senior management in commerce, including all related bureaucracies. Human tasking is just part of the tasking hierarchy; 99% of the time, it is repetitive, and thus, it often lacks active critical thinking and fails to generate new intelligence. AI is now targeting the corporate and bureaucratic hierarchies. The dawn of meritocracy emerges.

Realities:

Mindset Divide in Commerce: The mindset divide is the only differentiator between the two mindsets within the world of commerce. On one side, we have well-educated and career-minded job seekers eager to contribute to building enterprises. On the other, we have entrepreneurial job-creator mind sets, casually playing in the sandboxes, creating and starting such enterprises in the first place. Across 100 free economies, the house of economic development is divided, and progress is stalled on two fronts. Unfortunately, the issue of the mindset divide is not a top priority on the agenda because it was not explored.

Entrepreneurial Mysticism: The stark reality is that today, 99% of all economic development teams in free economies operate with a “job-seeker” mindset when what is critically needed is a “job-creator” mindset. No single enterprise was ever hatched on a chicken farm; only entrepreneurial mysticism started with a vision and a belief in an idea. This entrepreneurial mysticism, a term used to describe the unique blend of vision, faith, and courage that drives entrepreneurs to create and innovate, is the driving force, fueling the courage and creativity needed to break new ground and challenge the status quo. The big circus: With over 200 countries and five billion people, the world’s most connected and globally exposed population is watching the world’s top management, frustrated with productivity, performance, and profitability.

Solutions:

Urgency: We will conduct national audits to balance the approaches of job seekers and job creators, guiding up to 20–200 teams across the nation to apply models to boost productivity across SME sectors within 100 days. AI-driven audits will reveal mindset divides, allowing for rapid shifts to entrepreneurial frameworks that drive economic revival. Our orientations will engage national participants and foster entrepreneurialism. Clarifying the application of tacit and explicit knowledge in economic contexts is a game changer.

Mastery: Our advanced narratives on entrepreneurial mysticism will educate 10–100 senior economists on business mindsets, promoting the importance of entrepreneurial thinking for SME innovation via special workshops. By mastering the role of AI in shifting mindsets, nations can achieve significant productivity breakthroughs and gain a competitive edge in global markets. We will provide presentations to align stakeholders for long-term profitability, ultimately enhancing productivity and contributing to national economic growth.

Pillar 04:
The Carousels of Economic Prosperity

Compares elite shifts from grassroots to top, critiquing outdated economic models and proposing entrepreneurial solutions to counter debt-driven economic challenges effectively

Overview:

Economic Cycles Ignored: If the bottom 1% of the grassroots prosperity class of the nation is at the same spot as the top 1% of the elite class of the same nation but only a decade or so behind in their trajectory, and if this wheel of fortune repeats every decade or so and keeps spinning, and if the bottom SME sectors are already the largest economic contributors, then why not make them bigger? If the top 1% is already the most successful sector of the nation, then why not bring the two closer, expand, and streamline? Hence, what levels of expertise and special skills are required to navigate such deeply entrepreneurial minded deployment techniques and protocols, unheard of within any university in the world?

Entrepreneurial Continuity: Will this suddenly change the game for economic development in a country if it already has a proven top 1% elite entrepreneurial class that specifically came from the same historic tracks and faced identical struggles? Is there another 1% class in development with next-generation ideas to achieve national and global impact? What contribution can the Ministry of Finance and national political leadership make to create mandates and ride on this proven trajectory? When economic development cannot accurately navigate such commercial affairs, it is essential to recognize that the national economy needs to be in the right hands with a matching mindset.

Facts:

Shared Entrepreneurial Journey: A world of too many SME studies: Check out the last major 100 SME studies in the previous decade. Imagine watching a movie on Tarzan, where the filming is all about precise measurements of his bow, arrow, knife, and underwear, but nothing about who he is, where he came from, how he became Tarzan, why animals love him, and why is Jane chasing him and why he is called, the King of the Jungle? Just as entrepreneurs cannot write a scientific thesis, academic studies are distinct from entrepreneurial endeavors.

The Speed and the Pace: The economy is not a sprint but a marathon: Nations only advance through quality and discipline, with deep planning and long-term execution. Across Free Economies, there is no ‘Economic Crisis’; there is only an ‘Economic crisis on economic development skills.’ A quick audit of any national economic development will tell a surprising story.

Realities:

Need for Mobilization: This mobilization involves a concerted effort across the nation to inspire and support a shift in mindset toward job-creator entrepreneurship, where individuals can contribute to economic growth and development by creating new opportunities and laying the foundations for successful enterprises. Equally, without bringing all top national teams on board regarding economic development, the nation's uplift of the SME sectors will remain dormant. Furthermore, national and global academic institutions that claim entrepreneurship and SMEs as their backbone must come out openly and honestly, updating their thinking under the umbrella of entrepreneurial mysticism.

Global Economic Stagnation: Equally, chambers, trade groups, and associations must update and reorient their thinking; national SME mobilization will remain abstract rhetoric. At this stage, the economic development teams from 100 free economies are now being openly asked to explain how they will identify, assess, and manage such a continuation of superior entrepreneurial mysticism and build a solid, ongoing wheel of fortune in their nation. So, how long will the roller-coaster rides of the debt junkies last across free economies? The world has already spent a combined $313 trillion, and now it is not only addicted to debt but also broke and gasping for more.

Solutions:

Urgency: This expertise focuses on identifying and working with the nation's top 1% of the corporate elite and the bottom 1% of entrepreneurs, exploring how both groups originated within the country from the same century-old carousel of commerce and how it all started with tiny, unknown SMEs and some small operations became global giants and now play a role in the nation's elite economic landscape. This is a vibrant content area of entrepreneurial activity within a country. We guide and suggest how to manage and enhance the economic "wheels of fortune" by training 10–1,000 national teams from trade groups, chambers, and economic planning to promote small and medium-sized enterprise (SME) growth patterns in just 100 days. Bridging the deeper links between elite and grassroots levels accelerates SME scaling and counters with innovative growth models. Our presentations typically engage between 100 and 1,000 national participants, guiding them through essential mindset shifts. Such advanced narratives and special skills, when combined with local customization, create long-term perspectives that extend beyond the capabilities of economic development teams in over 100 countries.

Mastery: Our role as a fresh source of economic thinking enables us to advise national sectors and SME policies effectively. We unlock in our series of 10–20 workshops to orient each central region on cyclical prosperity, empowering SMEs to contribute to sustainable national wealth creation. Additionally, we offer orientations to facilitate stakeholder alignment and foster long-term growth.

Pillar 05:
Exposing Economic Intellectualism

Questions the validity of economic intellectualism, revealing a disconnect from entrepreneurial solutions needed to address debt crises and advance meaningful economic progress.

Overview:

Nobel Dreams vs. Economic Reality: There is nothing wrong with dreaming of winning a Nobel Prize in Economics. How can special economic thinking help save a national economy? The science of economics is primarily a series of numerical theorizations; the art of economists is found primarily as spectators of the main events of commerce, witnessing entrepreneurial actions on the tactical battlefields. Once measured, the progressions provide numbers, amounts tabulated, and columns queued, ready to be shaken and stirred for fancy, assorted glasses, with colorful cocktail umbrellas added as the tasty mixtures are poured in happy-hour style to the intellectual fraternity of like-minded job seekers, all in search of nobility.

Entrepreneurial Mysticism: Economists of the world, justifiably, all have one common dream: the Nobel Prize! Enter entrepreneurial mysticism: So, how will entrepreneurialism save a national economy? The art and science of entrepreneurial mysticism are shrouded, with dreamers exclusively seeking an earth-shattering solution to problems that may not yet have been discovered. It's always something the world knows nothing about. How many global leaders in the world of multi-trillion-dollar telecom sectors knew about "e-commerce" before it all happened, except for joking about nerds marching in Silicon Valley?

Facts:

Entrepreneurial Breakthroughs: What about the trillion-dollar hospitality sector? Were they all asleep before Airbnb launched? Check out the timelines of 100 of the world's top entrepreneurial legacies and how their craziness dazzled and advanced the world in each sector each time. Today, at this very moment, this crazy reality is constantly unfolding in the unknown streets of unknown towns and villages, shrouded in the unknown. Therefore, it is the opposite of numerical abstractions and theorizations, as only they have three-dimensionally structured real value creation growth models that have been proven to be a fundamental cause of constructive progress repeated over the last thousand years.

Limits of Theorization: Entrepreneurs did not stumble upon some dark cave and discover celestial parchments or voluminous studies about how economic theorization of previous centuries conclusively deduced how to take humankind out of darkness by inventing a glass ball of light. It was about the call of entrepreneurial mysticism, awakening an unknown lonely soul without any degree or special skills on either what glass is or what a bulb is. This lonely soul, against all odds, is brave enough to lead a journey into an unknown battle, a direction undefined, a vision shrouded in fog, but with a defined force, a carved will, and superhuman might to conquer the challenge without a map or a plan.

Realities:

Spectators vs. Creators: This may be what attracts spectators and others lined up to laugh at the pure stupidity of the period as they attempt to find unknown answers in the darkness. After 10,000 failures, the light bulb was eventually invented by Edison, bringing humankind to brightness —a testament to the power of the entrepreneurial spirit in driving innovation and progress. Half the world is laughing now about the many thousands fighting their imaginary dragons to save the grassroots prosperity of the world. Maybe someone is right on your street.

Need for Collaboration: Three Red Alerts: Nevertheless, failing to understand the 'mindset hypothesis,' the difference between the job seeker and job creator mindsets is the first red alert in any senior-level dialogue on SME economic recovery. Failing to articulate the 'National Mobilization of Entrepreneurialism' is the second red alert in any significant economic development activity. Failing to produce functional regional models of 'identification, categorization, and digitization' of potential SMEs is the third red alert of any SME sectoral policies.

Hidden Opportunity: How to Triangulate the current landscapes into an upward super productive spin to help create a new age of global SME prosperity and deploy 'national mobilization of entrepreneurialism' to up-skill, reskill, and uplift 5000 to 50,000 high potential exporters and manufacturers and let them loose on global digital platforms. The new world can handle micro trading, micro-exports, and micro manufacturing extremely well.

Solutions:

Urgency: Training 50–100 national teams in new economic thinking offers a unique approach to entrepreneurship in just 100 days. By exposing the flaws in traditional intellectualism, we can ignite solutions driven by small and medium-sized enterprises (SMEs) to reverse debt crises and foster innovation. Our presentations engage SME sectors, local trade associations, and chambers of commerce to guide strategies that create jobs.

Mastery: Achieving mastery in two key mindsets and embracing entrepreneurial principles can illuminate the path to SME innovation for senior management within 100 days. By debunking outdated theories, we help economists pioneer real-value economic progress on a global scale. We provide orientations that align stakeholders for sustained prosperity.

Pillar 06:
Navigating Global Economic Policy Disruptions

Addresses global economic disruptions stemming from flawed policies, linking debt and incompetence to the urgent need for innovative and effective economic reforms worldwide.

Overview:

Economic Disruption: The nationwide reorientation program is tailored to each nation's specific needs, addressing its current challenges. Economic intellectualism versus entrepreneurial mysticism: Numerical theorization often dominates economic thinking, focusing on charts and forecasts, while entrepreneurial mysticism drives real value creation through risk-taking and innovation. National administration and mobilization of Entrepreneurialism: Imagine the potential impact of awakening all national economic development teams simultaneously and quickly.

Entrepreneurial Mobilization: By demonstrating entrepreneurial understanding, adjusting narratives, and landing on the same page, we can instill new confidence. This will enable us to reach out to the inner sanctum of the small and medium enterprise sector core by core, displaying all available resources to create a national mobilization of entrepreneurialism as a national agenda.

Quick audit: What are the regional goals and globally targeted possibilities for uplifting the nation's entire small and medium-sized enterprise economy? National SME sectoral review: What will happen when "National Administration & Mobilization of Entrepreneurialism" (NAME) across the nation deploys the entrepreneurial talents of the citizenry, women, and youth and stimulates a better level of confidence and direction?

Facts:

Sectional methodologies: Step-by-step, entrepreneurial-style deployment to address entrepreneurial challenges managed by job-seeker and job-creator mindset balance to match the national economic growth targets.

Entrepreneurial Mysticism: This force leads them on a journey with no plans or maps, yet they create national and global giants and change the nation's face. This force, which we call entrepreneurial mysticism, has been the driving force behind all original ideas that have created a world of commerce over the last thousand years. The challenge is why they are so feared by academia, why their government and related ministries ignore them, why they are rejected by banks and the leaders of the day and are only laughed at for their crazy ideas, later only worshipped for their wealth.

National Mobilization: The mandate is to streamline the nation's mobilization of entrepreneurialism, deploy the protocols, and assist national leadership in creating a national mandate and a countrywide open agenda to bring up entrepreneurs as a national treasure and orient the nation to be entrepreneurial in action. When both the job seeker's mind and the job creator's mind work in alliance, magic happens.

Realities:

Historical Precedents: Henry Ford was the innovator who didn't invent the tire or the car engine but revolutionized manufacturing with the assembly line. This concept of the national mobilization of entrepreneurialism, a highly efficient, assembly-line-streamed 24x7x365 SME upskilling operation, is now gaining global attention, a testament to its potential to uplift the nation's SME sectors and drive dynamic economic growth. The lack of a job-creator mindset among national economic development teams has hindered the ability of economic intellectualism to effectively organize, support, and expand entrepreneurial activity on a national scale.

Current Gaps: Currently, no year-long programs focus on entrepreneurship across 100 free economies. Instead, there is only an annual SME week for photo ops and a plastic award dinner night. Additionally, entrepreneurial activities are often viewed as small, like children playing in sandboxes. This is a call for preparation and readiness to face a severe disruption of economic thinking regarding SME economies, entrepreneurship, and the future scalability and growth of national enterprises.

The Five Rules: One: Balance the 'mindsets' across national economic development for everyone's future. Two: Recognize 'entrepreneurialism' as one of the top national drivers of the economy. Three: Accept 'SMEs' as the largest job creators and tax contributors of any country. Four: Explore 'alpha dreamers' and establish a credible program to assist their trajectory. Five: Create a national mandate on the 'national mobilization of entrepreneurialism'

Solutions:

Urgency: We provide advisories on current economic disruptions and train 100–200 national teams to master the art and science of mobilizing SMEs and studying models within 100 days. Guidelines on how to harness 10,000 to 100,000 SMEs and place them on 3–5-year upskilling plans leading to global digital highways. By addressing policy limitations, we implement entrepreneurial strategies to stabilize economies during periods of global disruption. Our presentations engage 100–1,000 participants, guiding them through entrepreneurial practices. Clients can direct growth through national mobilization strategies.

Mastery: Our advisements to economists on economic disruptions while promoting the upskilling of SMEs, mastering policy reform, and aligning global trade strategies to foster resilient economic growth. We provide orientations to align stakeholders for long-term prosperity. Clients gain mastery over entrepreneurial practices, enabling them to contribute to global economic progress.

Pillar 07:
End of Mismanaged Economic Empires

Links economic collapse to debt mismanagement, illustrating how debt-addicted systems fail and necessitating entrepreneurial strategies to rebuild sustainable economic frameworks.

Overview:

Dynastic Decline: Dynasties do not die; they are only killed by their citizens. But all dynasties die as if the time of their fall is already predetermined. Dynasties were initially conceived and formed by people, not by the number of donkeys or horses they owned. Whatever forces humankind possesses, the secret powers were always the skills of the citizenry, as nothing else can ever be discovered, deployed, or invented to create productivity. Dynasties helped build new ideas of the time.

Citizery's Role: Always the minds, fortitudes, and vision. They tolerated masses, culture, and traditions to manage the vast spread of territories and boundaries. They achieved exemplary results and carved their place in history. Nevertheless, when superior winning skills mutate, they ensure the decline. When leadership fails to discern the truth, it fabricates false narratives, much like the Tower of Babel, and no longer has the ears to listen, eyes to see, and heart to feel. It starts to die. In this charade, it suddenly falls out of bed like a dead body with a big thump. Hence, despite all the staging and spotlights, it is already dead when a dynasty is in taxidermists' hands. After the vibrating thump and echoes, there is no need for forensics; already dead for too long, historians carve and divide the body.

Facts:

Citizen-Driven Collapse: With hundreds of nations and countries already wiped out from the earth, whenever the grassroots prosperity is inflamed, political incompetence glorified, and corruption institutionalized, the downfalls start to get framed and orchestrated. Dynasties, as always, before being eaten alive by external forces, were only brought down by their own starving and restless citizenry. Therefore, once the citizenry stops nursing a dying mammoth, the scavengers gather around for mortal blows. Dynasties do not die; they are only killed. As their citizens happily kill them.

National Identity: Nations are an assembly of people with a common cause and a shared boundary that fortifies their nationalism. The borders fall when the same people lose competence and drift into chaos. Learn to recognize the signs, especially in great empires, when prolonged injustice leads to the breakdown of the system, creating perpetual distrust, restlessness, hunger, and worthlessness; a strange morbidity begins to appear. The social order of instinctive humankind laws always seeks peace and grassroots prosperity. When any dark shadow becomes a cause of fear, and any night is an invitation to death, one can hear the crackling of the floors, vibrations of tectonic shifts, the distant drumming and thumping of the citizenry, and deep cries to overthrow the empire.

Realities:

Inevitable Collapse: Later, it collapses, leaving a chapter in history books. Why is this important? Are our current dynasties still breathing and alive, or are they already dead in the water? Understanding a dynastic fall first requires a better understanding of the rise of a dynasty. Like a biological cycle, no dynasty can stay forever young. Any bottomless decadence and visible dysfunctionalities eventually consume the mindless collapsing body, unable to differentiate its citizenry from invading enemies, activates self-infliction to its body, like a flesh-eating disorder, where no amount of medical help can ever save it from death.

Leadership Failures: Hence, the orchestra on the deck of the Titanic represents today's fake socio-political leadership, already thriving and mesmerized by Wokeism and hypnotized by Fakeism, where they have comfortably assumed their last joys as the last gala night and show, marking it as a great success. Nevertheless, today, nation by nation, dynasty by dynasty, where is the national leadership? Where is the harmonious synchronization with the national order of administration, policies, and mobilization of programs to uplift national citizenry and prepare it for the global age of competitiveness? Where are the visible displays of deep knowledge? Where is the stage to measure and test wisdom, if there is any left? Where is the proof of any integrity left to direct the youth and future, and where are those demonstrable skills left to uplift the dynasty to face the future?

Solutions:

Urgency: Most nations are facing what appears to be a lost generation in terms of skills, attitudes, and confidence. There is a need for mandated national policies and initiatives like the Marshall Plan. Implementing a fast-track training and orientation program over 100 days, when extended to 100 to 1,000 economic development staff nationwide, can lead to innovative solutions that improve the lives of citizens. We help prepare for and address long-term challenges, promote entrepreneurship to rebuild sustainable economies and support the growth of small and medium-sized enterprises (SMEs). Our presentations engage 100 to 1,000 participants while guiding grassroots strategies for prosperity.

Mastery: Our globally recognized narratives help teams of national economists understand the hidden strengths of mobilizing entrepreneurial spirit within their countries. We empower nations to rebuild citizen-driven prosperity and attain global economic resilience. We offer guidance to align stakeholders for sustainable long-term growth. National teams learn to master grassroots prosperity, enhancing their international competitiveness.

Pillar 08:
Trumpization of Global Commerce

Highlights a global trade crisis exacerbated by tariff panic, debt fears, and a lack of entrepreneurial solutions to create a billion SMEs and a billion new jobs.

Overview:

New Economic Vision: In the course of human endeavor, no other experiment has been as successful as that of the United States of America. Its entrepreneurial spirit, a mysticism that has no equal, has transformed it into the world's only entrepreneurial nation. From its roots as an agro industrial power to its current status as a technological giant, the United States has consistently demonstrated the power of entrepreneurialism.

Is There New Order: President Trump speaks every day, surrounded by over 100 reporters and mega-billionaires, primarily assembled as the top minds of the new world. They have extraordinary global reputations, unique skills, global-age crafts, and superb proven track records. Here is a straightforward interpretation of how this new thinking applies to the existing international economic order and why prioritizing the greatness of each nation is the right approach. Only meritocracy will save the world from economic incompetence. The old-world order is no order at all. Make your country economically great. Implement new changes to create a highly skilled national citizenry. Open dialogue, right or wrong, is a must.

Facts:

Leadership Shortcomings: What can the world learn from Trump's speeches? During the last decade, most national political leadership had no additional extraordinary skills to tackle, test, or audit such flat progress. If they had the answers, they would have been implemented decades ago. China was not a sudden miracle; it was an open book on how it uplifted its national citizenry to become the most skilled and motivated workforce, larger than all Western economies combined. Today, in addition to charts and ongoing debates over theories or panic aimed at protecting national economies from a sudden plunge into a global financial crisis, this primarily occupies the nation's attention in terms of economic development.

Global Competitiveness: Are global political leaders truly prepared to make their nations great? National political leadership often lacks a clear understanding of international competitiveness and national productivity. The emergence of AI has transformed the landscape, shifting the focus from physical labor to more complex mental challenges that aim to demonstrate superior cognitive performance. This shift necessitates a more sophisticated approach to human resource management, reflecting a significant change in global economics. Meanwhile, a restless workforce comprising billions of citizens is slowly becoming restless yet eager for change and transformation in the future. But how can we transform the workforce and orient it for a national mobilization of entrepreneurialism, and how fast?

Realities:

Debt Crisis: Furthermore, endless debt is a national crisis. Example: USA debt: 1950: $257 billion; 2000: $5.6 trillion; 2024: $36 trillion; 2030: $50 trillion? If his teams are only 10% successful, Americans will resculpt Mount Rushmore, and a shockwave will reverberate across 100 free economies, challenging their current levels of competencies. America is not alone; there is a global default on a prevailing lack of economic wisdom, which appears more like outdated academic book wisdom and has now lost the art of a 24/7/365 war of new skills and highly competent global reality. If this leads to the decline of the United States, what proactive measures are currently in place to address this issue?

Economic Incompetence: Without reskilling and uplifting economic intellectualism, the economic sectors of over 100 free economies remain strangled for another decade. Yearly progress measured through abstract charts often rewards the status quo, leading to economic stagnation. This environment lacks open dialogue and collaborative events, promoting a prevailing silence. The bronze medal economies: Awareness of the greater economic challenges and creation of small and medium-sized enterprises (SMEs) is mostly missing.

Solutions:

Urgency: Commonsense ideas and strategies are essential when chaos obscures clarity. Trump inspired trade reforms are driving a new wave of global commerce, led by small and medium-sized enterprises (SMEs), which provides a counter to tariff-driven debt crises. Once 100 to 1,000 frontline economic teams have participated in specific workshops, a new future can emerge. Our presentations engage between 50 and 500 participants, guiding them in entrepreneurial strategies. Clients can take control of trade and export growth through national mobilization.

Mastery: The primary challenge is identifying and declaring a starting point; we assist in recognizing and initiating the necessary actions to foster SME-driven prosperity. By mastering meritocratic trade models, we can reshape global commerce to drive competitive national growth and development. We provide orientations to align stakeholders for long-term competitiveness and success. Clients gain expertise in economic revival, allowing them to influence global expansion.

Pillar 09:
Crafting Entrepreneurial Strategies for 2030

Proposes long-term entrepreneurial strategies to counter debt-driven economic models, fostering global political and economic innovation for prosperity by 2030.

Overview:

Bureaucratic Overhaul: The visible panic over the survival of over 100 free economies intensifies in 2025; the chainsaw teams of Trump go live with their show on how to reform government bureaucracies, while the world's political and economic theaters have already focused their binoculars on watching and observing actions from their far-off hideouts. The teams will enter like trained uniformed gardeners with lawnmowers, machetes, weed killers, and clippers to change thick jungles into landscaped lush gardens with rows of floral arrangements, all geared to set examples of result-driven, non-stop, hyper-performance stream to support the national agenda with zero waste across the USA.

Entrepreneurial Focus: This will be the first-ever blossoming of the world's most extensive and expensive bureaucracies in the history of the United States and possibly the world. Governments can no longer rely on academically generated theories of "political economy" that merely dance around the national economic crisis, addressing global issues from national debt, climate, logistics, and poverty, while ignoring the essential task of well-defined internal order to get national economic development framed for domestic agenda. Chasing faraway, abstract, and unachievable ghosts only distracts the subject and undermines local and national productivity. It's important to note that this situation is not entirely their fault.

Facts:

Lack of Practical Training: What university courses, government training programs, or books can they refer to that have truly equipped them for this challenge? On a global scale, the industrial political-economic complex primarily manages international economic affairs on a nation-by-nation basis. Everything will improve if pragmatic and workable solutions are immediately implemented alongside current strategies sharply focused on commonsense economic realities at home. Economic intellectualism lagged by a decade when e-commerce was first introduced, while today, the national mobilization of entrepreneurship is a decade ahead.

Entrepreneurial Urgency: Hence, openly challenged on the global stage: When will economic intellectualism finally surrender to entrepreneurial mysticism? What is needed are visionary thinkers with intellectual insights to restore small and medium-sized enterprises (SMEs), especially considering the current challenges.These four billion factors, coupled with the impact of AI, present a significant challenge today, often detailed within academic or economic circles. This calls for entrepreneurial mysticism to deliver national mobilization of SMEs and lead micro-trade, micro-exports, and micro-manufacturing as a respectable national trading culture. A quick audit of any national economic development will reveal surprising insights.

Realities:

Economic Failures:
Entrepreneurship is humanity's unique ability to create change, transforming seemingly impossible ideas into successful enterprises and fueling economic growth. So far, neither the business sector nor academia has established a systematic method, solution, or practice to achieve this effectively. While economic theorists may analyze and predict trends, they often overlook the potential of entrepreneurship to drive genuine growth through the creation of real value.

The Gutenberg Press revolutionized the printed text and fostered widespread dialogue and narratives, igniting a quest for more accurate answers. Humanity awakens periodically to new ideas. Just as cave dwellers faced challenges when wheels replaced their square tools, this is how it was written: This is how it is being told. The world has endured the harshest tyrannies, yet the human mind has consistently triumphed over adversity to rescue humankind.

Solutions:

Urgency: In times of economic stagnation, expert guidance is essential. We offer advice on hyper-performance economics, training senior teams from 50 to 100 members to implement effective strategies and mobilize planning for the SME (small and medium enterprises) sector within 100 days. Our specialized workshops and intensive discussions challenge existing mindsets and promote balanced thinking. By crafting strategies focused on 2030, we aim to spark SME innovation and combat global debt-driven stagnation.

Mastery: We provide advisory services for Cabinet-level planning. Once speed and execution guidelines are established through our 100-day hyper-performance economics approach, we can foster SME-driven growth. By mastering long-term entrepreneurial planning, we help nations lead global economic innovation by 2030. We also offer orientations to align stakeholders, paving the way for long-term prosperity.

Pillar 10:
Creating a Dozen Chinas

Advocates replicating global entrepreneurial success to counter debt-driven models, building new economic powerhouses through innovative strategies and growth.

Overview:

Economic Stagnation: National grassroots prosperity, when barren, charred, and on wildfires, while restless citizens are in chaos, as in over 100 free economies today, is not because of the absence of wealth; it is the absence of productivity. Economic intellectualism, the guardian of the global economy for decades, is now openly challenged. Productivity is rooted in the "physicality" of "work," the old industrial-age hierarchy of human resources.

Entrepreneurial Revival: Such challenges today extend well beyond the realm of economic literature and games of theorems. The "mentality of performance" is a new global human resource management driver. Economic development at large is a re-examination of everything that has already happened rather than predicting what is about to happen. This fact-based limitation and fear of risk is a common academic job-seeker mindset trap when tabulating the present in the cautionary hope of reading the future. In contrast, the entrepreneurial, out-of-the-box, risk-taking, job-creator mindset thrives on it. Such dramatic differences occur, where decades are wasted, economies crash, and generations miss their goals.

Emergence of new thinking: Is China Teaching Socialistic Entrepreneurialism to Free Economies of The World. With 105 cities with populations over one million, China's urban growth is unmatched, outpacing India with 65 cities and the USA with just nine cities.

Facts:

The Entrepreneurial Races:
What is happening in China: 100 years ago, China was an unknown country despite 4000 years of history and glory. 50 years ago, China was unknown on all global economic lists and indices. 30 years ago, it was laughed at as an upcoming country in the West. 10 years ago, it was labeled as an economic threat to the West. Today: Is it pre-war time now?

What is happening in the USA: 100 years ago, the USA was the most respected country despite its short history and glory. 50 years ago, the USA was the top player in each global economic list and indices. 30 years ago, it was laughed at for losing its focus and missing its edge. 10 years ago, it was labeled as a threat by half the world. Today: Is it just in chaos selecting war themes

Global Success Models:
This is how the world's first-ever nation, the USA, created the largest economy and the largest and longest-thriving middle class. It has been adopted and modified to socialistic Entrepreneurialism in China, and this is precisely where India and dozens of other nations are headed. Today's world is spinning toward broader global trade, relying heavily on entrepreneurial decisions rather than the colonial-era economic studies of the past.

Realities:

Need for Debates: Even if the above assertions are incorrect, they should not close the doors for open debates. Silence now indicates a fear of exposing levels of competencies. In search of immediate solutions, regardless of the circumstances, the times call for action; the narratives are now sparking new global debates. The urgency and action are paramount. Why is it challenging to apply new narratives and deployable methodologies across all major SME sectors within the GCC, OIC, European Union, African Union, Commonwealth, BRICS, and ASEAN for the national mobilization of entrepreneurialism as immediately applicable, pragmatic solutions?

This not only creates a divide between economic intellectualism and entrepreneurial mysticism but also raises serious questions about how rapidly the world has advanced on so many global fronts yet visibly failed in its economic strategies, visibly damaged, with little or no progress across three-quarters of the world now in the grip of fiscal chaos.

Global Shockwaves: The Trumpization of America will create global entrepreneurial shockwaves, sometimes sweeping away traditional systems and deeply entrenched bureaucracies of economic models based on procedural entrapments. American liberation from the games of economic theorems: If Trump and his team survive politically, it will change the global order of governance to focus on entrepreneurial models rather than complex theoretical frameworks and mere rubber stamping. This situation represents an open clash of economic intellectualism and a stage for entrepreneurial mysticism. Let the games begin.

Solutions:

Urgency: China and Asia present numerous opportunities for entrepreneurs. We offer a comprehensive 100-day guideline on how to cultivate entrepreneurial nations, followed by long-term training for internal national teams, which consist of over 200 members, to support the mobilization of small and medium-sized enterprises (SMEs). Our presentations engage between 50 and 500 participants, focusing on strategies for micro-trade.

Mastery: To navigate the economic landscape successfully, it is essential to have a deep understanding of China. Our analysis clearly distinguishes the differences for economists regarding entrepreneurial nations, promoting the growth of SMEs. We primarily cater to senior teams, providing orientations for 50 to 500 stakeholders to align them with the long-term goals of global trade. These sessions are highly tactical and serve as long-term planning meetings to prepare the Cabinet for the national agenda.

Pillar 11:
SME Economic Oceans Avoiding Digital Deserts

Critiques of over-digitization without entrepreneurialism emphasize the importance of the oceans of SMEs to drive economic growth and innovation.

Overview:

Virtualization Challenges: The "virtualization of economies" is not a mysterious process but rather a natural outcome of the digitization of small and medium businesses. It refers to the shift from traditional, physical economies to digital, virtual ones, where trade and commerce can occur globally without the limitations of physical distance or borders. It is the "cyber-hyper-processing" of everything from A to Z. However, if digitization becomes the prime focus, entrepreneurialism declines, and in the absence of the national mobilization of entrepreneurialism, digitization only creates dry digital deserts.

Entrepreneurial Balance: Digitization is critical structure, like accounting or manufacturing; it is only part of the structure that holds and balances an entrepreneurial enterprise. Entrepreneurialism, boldly evidenced by the creation of small and medium enterprises, has been the cornerstone of building today's robust economies. The last few hundred years stand as a testament to its role in shaping global commerce. The processes of digitization, born out of entrepreneurialism, have not only accelerated growth but also electrified and revolutionized efficiency worldwide. Unless there is a clear understanding of grassroots prosperity, it will primarily create oceans of SMEs. This will create fertile gardens where digitization brings superb growth, flowers blossom, and birds sing.

Facts:

Digitization vs. Entrepreneurialism: In isolation, digitization only creates deserts, while entrepreneurship creates oceans of SMEs. Having dynamic SMEs with digitization creates larger and globally adventurous economies. Nations with the highest number of IT professionals often have the highest level of digitization but not necessarily the highest number of SME growth or entrepreneurial activity. Why is this the case? Observe nations worldwide, especially those with the highest numbers of IT professionals, affluent and well-groomed government departments and related agencies, mature bureaucracies, and a high number of computers. However, they still need signs of entrepreneurialism to originate and deliver thriving digital economies buzzing on global platforms.

Historical Context: Silicon Valley created the entire playbook on e-commerce; however, it is now surrendering to the realization that entrepreneurialism is the primary driving force behind such challenges, rather than the herds of IT teams or elaborate bureaucracies. The original invention of "IT" was an entrepreneurial adventure. The original Silicon Valley of the USA was neither an academic nor a financial revolution but rather the mobilization of an entrepreneurial journey long before the term "IT" became popular and "technology" was conceptualized as worthy of trading in billions. The clusters of entrepreneurs in the march, with revolutionary job-creating mindsets, emerged from their garages, broke old systems, created new alternatives, and changed the world forever—a revolution of entrepreneurs created by entrepreneurs and for entrepreneurs.

Realities:

E-commerce Transformation: E-commerce was the first and the biggest-ever transformation compressed on the fastest tracks. Over a billion became IT experts in the following decade. The rest is history. Today, some 100 other nations are still trying hard to become copycats with their versions of Silicon Valley. What is a digital economy? It is not when all businesses have websites and are engaging in social media postings; at the outset, understanding the digitalization of a single enterprise is already a fine art, and making it thrive on global trade platforms is a science.

The National Mobilization of SME Entrepreneurialism:

Fact: The world can easily absorb unlimited exportable ideas across an unlimited number of vertical markets.

Fact: The well-designed innovative ideas are worthy of such additional quadrupled volumes.

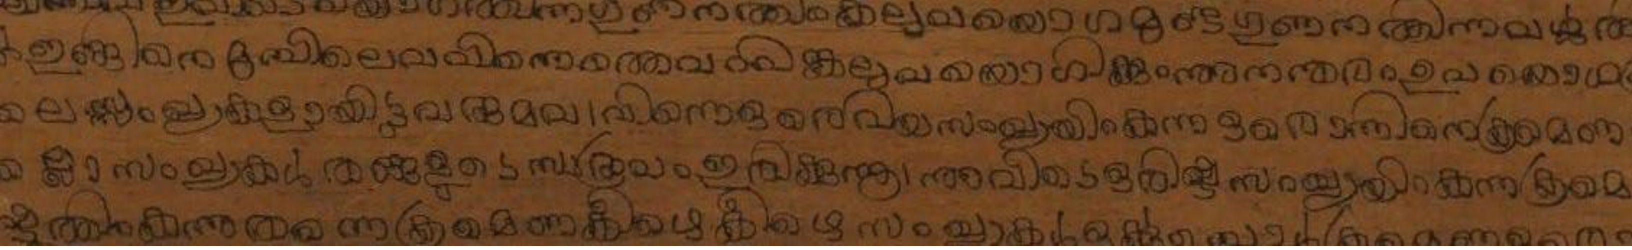
Fact: A nation's entrepreneurial and dormant talents can perform such tasks.

Fact: The new global age skills, knowledge, and execution are now the missing links

Solutions:

Urgency: Not knowing the difference between a "dry digital desert" and thriving "oceans of SMEs" is a significant issue. We develop growth patterns and help identify high-potential SMEs, providing advisory services on entrepreneurial opportunities. Our goal is to train 200 teams on clear rules of engagement to digitize SMEs within 100 days. By striking a balance between digitization and entrepreneurship, we foster vibrant SME ecosystems that support global trade and commerce. Our workshop series, which energizes city and national teams across the nation, guides participants in developing effective virtualization strategies.

Mastery: The lack of clear direction poses a significant challenge; our authoritative narratives, informed by global experiences, guide economists on entrepreneurial opportunities and promote the digitization of SMEs. By mastering the synergy between SMEs and digital platforms, we enhance global competitiveness through innovative trade solutions. We provide orientations to align 100–500 senior frontline economic teams over 100 days, focusing on long-term success in international trade, emphasizing the power of technology, strategies for going global, and providing clear guidelines.



Pillar 12:
Tactical SME Strategies for 2030

Offers tactical SME solutions to counter debt and enhance global competitiveness, fostering prosperous free economies through entrepreneurial initiatives by 2025.

Overview:

Tactical Economic Battlefields: When a country resembles an open tactical battlefield, focusing on building its citizenry and fostering a strong export-oriented economy, two key developments arise: government bureaucracies begin to focus on SMEs as taxpayers, and economic academics start to study historical patterns. An economic mindset is that of a job seeker, and an entrepreneurial mindset is that of a job creator. The entire governmental bureaucracy focuses on taxes and economic academics on charting and data manipulation. At the same time, small clusters and large groups of small and medium-sized enterprises are crucial tax contributors driven not by economic theorems but by the 1,000-year-old laws of entrepreneurialism.

Entrepreneurial Drive: Economic mindsets focused on job-seeking fundamentally differ from those of entrepreneurial job creators. Moreover, over 99% of economists in the free world have never started a small to medium-sized enterprise (SME) or managed a job creation project that involves taking real risks. Consequently, academic economics and their lack of understanding of entrepreneurship begin to stand out.

Consequently, their experience is based mainly on historical data, charts, and theoretical models. They primarily engage in checking, adjusting, and forecasting data. Still, they have little insight into the reasons behind the creation of an SME, the individuals involved, and the personal risks they take.

Facts:

SME Growth Challenges: They often lack awareness of how an SME can evolve into a large, global enterprise that has a significant impact on the nation. Running a national railway system: Imagine a team of millions responsible for managing railway tracks across a large region, equipped with extensive knowledge of every foot-length of the railway line and every signal. Now suppose, However, these individuals have never seen a train, ridden on one, or operated a locomotive. In that case, they lack an understanding of the national railway system’s strategic goals and objectives and its operational, seasonal, and skill demands.

Entrepreneurial Mysticism: Hence, SME and national mobilization of entrepreneurs is not just a game of switching green and red signal lights or displaying colorful flags. Still, it is an entrepreneurial battle fought by unknown entrepreneurial warriors who are always intuitively advanced but still appear blindfolded, creating and establishing new ideas into “crazy” enterprises with no plans, no guidelines, and no explanations for solutions to unexplainable problems, all bundled as “entrepreneurial mysticism.”

Over more than 1,000 years, this proven practice is the only evidence available on how superpower economies were developed, as they were not derived from economic books or games of theorems.

Realities:

Economic Team Deficiencies: This training should encompass not only how SMEs drive economic growth but also identify the key contributors to this competitive race for prosperity. Without this understanding, the economic landscape across 100 free economies will continue to demonstrate apparent failures. Are your national SME economic sectors booming, exporting, growing, and creating national wealth? If not, declare a state of economic emergency. Countries have positive options to consider: They can build a critical mass by developing a skilled workforce capable of initiating micro-trade, micro-exports, and micro manufacturing on a national scale.

Global SME Opportunities: Second, the global small and medium-sized enterprise (SME) boom, which previously required substantial investment—around one million dollars in technology over the last decades—is now accessible for less than $1,000 worldwide. Third, the world is increasingly open to collaborative and innovative thinking, where entrepreneurialism transcends borders and becomes more valuable than mere degrees. Why did the mighty economists of the world miss so badly? Historically, superpower economies have always emerged from the vast array of small and medium-sized enterprises. As always, some grew into Godzilla-sized global giants, changing the face of their nations. They were afraid of the powers of entrepreneurial mysticism.

Solutions:

Urgency: The global free economies require significant assistance. One effective solution is the formal training of 200 diverse teams from different economic sectors, aimed at understanding how to mobilize small and medium-sized enterprises (SMEs) nationwide. Through our globally recognized dialogues, which engage a wide range of participants—both small and large businesses, trade associations, and chambers of commerce—we can foster a new spirit on national economic fronts.

Mastery: Every free economy requires innovative economic thinking. Intense orientations over 100 days, with global narratives, educate economists about strategic SME landscapes and promote growth in micro-exporting. By mastering SME-driven trade, we position nations for global economic leadership by 2030. We also provide long-term strategies to align stakeholders for sustained prosperity.

Pillar 13:
Entrepreneurs for Economic Revival

Proposes an entrepreneurial influx to combat economic stagnation, opening gates for entrepreneurial revitalization of national economies through dynamic immigration and rewards.

Overview:

Entrepreneurial Immigration: It takes about a century to establish an entrepreneurial nation naturally, and it takes a quarter of a century of strategic planning to understand how to utilize its power effectively. Critical thinking is necessary at the national economic level to enable millions of qualified young and old entrepreneurs to enter the country under special visas.

Global Prosperity Solution: Currently, 100 free economies are in dire need of a solution for economic prosperity. A sudden influx of 1–5 million entrepreneurs will quickly transform the nation's landscape and propel it onto the global stage. "Allow a million qualified foreign entrepreneurs to park within your nation for 5–10 years under a special full tax-free visa and stay program. Which nations have qualified dialogue on such affairs? Bring in, land a million entrepreneurs in your nation, and create 10 million-plus jobs and new wealth in the following years. Let your institutions and frontline management learn how such economic developments are created. Be bold, as the time to strategize has passed; now the time to revolutionize has arrived." Excerpted from keynote lecture by Naseem Javed, Global Citizen Forum, Dubai, 2013.

Facts:

Entrepreneurial Potential: Education will not solve the national economic struggles; mobilization of targeted skills will. Border walls and the army will not stop immigration; the massive uplift of the grassroots economy and the national mobilization of SME entrepreneurialism will achieve it. For a deeper understanding, study the National Mobilization of Entrepreneurialism on Google. This concept, developed over a decade ago, advocates for the widespread upskilling of exporters and reskilling manufacturers to quadruple productivity, performance, and profitability and is now gaining global attention. The National Mobilization of Entrepreneurialism is a strategic initiative that aims to harness the potential of entrepreneurs, both young and old, to drive economic growth and prosperity. For the first time in the last 100 years, governments across the free world have failed to upskill citizens.

Global Workforce Crisis: They now face the 4B Factor: a billion workers are displaced due to the pandemic, a billion are replaced due to automation, a billion are misplaced due to improper job titles, and now a billion are on starvation watch due to collapsing economies. This unprecedented situation requires immediate and innovative solutions to prevent a global economic crisis. Entrepreneurialism is a natural talent available worldwide, one that has been present on the streets of the world since the dawn of history.

Realities:

Policy Innovations: How fast can all national front-line economic development teams be oriented and trained? Allow 1–2 million highly qualified entrepreneurs to have a special tax-free window on the first few million in export revenues; this will create local jobs and bring foreign exchange. Allow small and medium-sized enterprises free access to all dormant intellectual property. Allow academic experts and scientists to access innovative technologies and related skills through free voucher programs. Allow small and medium-sized enterprises to offer full-time MBAs as 12-month government-paid internships, enabling graduates to acquire real-world entrepreneurial experience.

This incentivized tax-free visa, with full exemptions in the early stages, is not a luxury but a necessity to attract highly talented individuals to transform the nation rapidly within a decade. It may take less than a decade to attract millions of proven entrepreneurs and transform the face of the host nation.

Allow millions of qualified entrepreneurs to land within a nation for 5–10 years under a unique tax-free visa program. Mandate the National Administration of Entrepreneurial Mobilization to engage trade and export bodies. Yearly bureaucratic lip service to SME sectors has not produced anything during the last decades; it is the national mobilization of exportability and manufacturing. Of course, massive organization is needed to bring all parties on the same page and start as a national agenda. As China did a few decades ago, India a couple of decades ago, and dozens of other nations are getting ready now. It is a race, and not all countries will win. Study more on Google.

Solutions:

Urgency: As over 100 million entrepreneurs embark on a global quest for better opportunities, countries must develop strategies to attract top talent. To support this influx of entrepreneurs, we offer Cabinet-level and national-scale training for senior teams of 50 to 150 members. This training will help them develop effective entrepreneurial management programs. Immigration-driven entrepreneurial surges can generate millions of jobs and revitalize economies through bold visa initiatives. Once we identify participants and their plans, we will assist them in implementing tax-free visa strategies.

Mastery: Entrepreneurial mysticism is a specialized field that, when combined with economic mindsets, leads to mastery. We are prepared to empower nations and their selected team members—ranging from 50 to 200—leveraging global entrepreneurial talent to drive economic revival through innovative policies. Additionally, we provide orientations to align stakeholders for long-term global trade initiatives.

Pillar 14:
First, Make Yourself Great

Emphasizes individual entrepreneurial upskilling to counter the debt-driven economic decline, empowering individuals to drive personal and collective prosperity through innovation.

Overview:

Individual Empowerment: First, make yourself great: Making your country great will automatically follow. For the past 1,000 years, the path to success has been through higher education. However, this is no longer the case, as outdated education often becomes only a liability, lowering growth potential. Discovering your mindset and continually training and retraining will always reveal new ideas and provide unique ways to grow exponentially. Contrary to popular belief, the world's success was not achieved by degree holders but by those created, produced, and managed by entrepreneurial job creators —risk-takers who think outside the box with creative mindsets.

National Uplift: First, make yourself great and help build the national citizenry; later, this will automatically make the country great. For many decades, the free world and its economic and political leadership focused on their own countries, but more often than not, preferred to focus on far too many other countries, directly harming their national citizenry and leaving them behind in skills, confidence, and, most critically, by ignoring local grassroots prosperity. The rise of populism is not a fault of the public but rather a result of prevailing economic policies that challenge decency in living and law and order management by the current national leadership.

Facts:

Economic Decline: Today, over 100 free economies are addicted to national debt, mesmerized in their pursuit of abstract global goals, and teetering on the verge of economic collapse. National citizens cannot stand up to the international age of competitiveness; national exports are dead, and foreign investments have fled. Welcome to 2025 and new economic revolutions. Understanding the landscapes: Why is building the nation first and building the country second? A nation is only formed when enough people unite through common ideology, culture, religion, and a shared struggle. They fight, sacrifice, and establish rules, laws, and borders. They work together to build a stronger nation.

A quick study of 100 free economies speaks volumes, despite big-budget propaganda against communist China, which overlooks how it has built the world's most highly skilled, motivated, and experienced workforce, larger than all Western economies combined.

National Strength: Stronger nations have a stronger, more unified message; stronger nations have stronger borders as countries. Countries without borders are akin to real estate projects; without culture and shared goals, they are merely like carnivals; without ideologies, they are like broken tribes in a caravan. You don't need mountains of gold and diamonds to build a great country; you need national citizens who are already the hidden gold and diamond assets, once capable of standing up to global competitive agendas. The collective wealth of the citizenry supports the country, and productivity is this economic power that ultimately determines a country's prosperity.

Realities:

Economic Incompetency: Economic development is not a walk in the park; it is, instead, a war against economic incompetence, a new struggle to shed old traditional mapping and charting in favor of timely, dynamic national mobilization of entrepreneurialism. Across most free economies, the socio-economic goals of daily survival and appeasement policies have now evolved, and each goal has transformed into vibrant, psychedelic balloons—each one more colorful, illustrative, and festive than the last. Each one invites as if economic development on a typical sunny day has become a happy-go-lucky walk in the park. This is instant proof of a lack of capabilities and job-creator mindsets to grow economies.

Policy Failures: The bitter medicine pill: Economic development without entrepreneurialism is only economic destruction. Political power without economic power is no power at all. Increasing the debt ceiling is a grand economic failure. Abandoning a national citizenry unable to stand up to the global age of competitiveness is a political failure. The inability to identify, categorize, and digitize high-potential SMEs is an economic development failure. Trump will attempt to change this, and if only 10% are successful, a shockwave will reverberate across 100 free economies, challenging their current levels of competencies.

Solutions:

Urgency: To gain a deeper understanding of self-discovery as a key tool for unifying goals, we guide the deployment of strategies aimed at uplifting citizens. We train national teams to mobilize agendas effectively within 100 days. By empowering individuals through skills development, we foster an entrepreneurial mindset that drives national prosperity, even in the face of debt. Our guidance on entrepreneurial strategies helps control prosperity through national mobilization.

Mastery: Mastery cannot be achieved without self-discovery. Our focus on talent and meritocracy leads to significant improvements in productivity. By mastering personal entrepreneurial growth, we empower citizens to become economic drivers of global success. Our lectures provide valuable insights to economists on the importance of citizen uplift, encouraging growth driven by small and medium-sized enterprises (SMEs). We offer orientations that align stakeholders for long-term competitiveness.

Pillar 15:
Socialistic & Capitalistic Entrepreneurialism

Compares socialistic and capitalistic entrepreneurial models to address debt and stagnation, seeking balanced innovation strategies for global economic prosperity.

Overview:

Comparative Success: This is not a harsh critique of the limitations of current economic development procedures worldwide but an entrepreneurial response to facilitate significant progress. At the same time, it compares the remarkable success of China's national mobilization of entrepreneurialism, whether socialistic, communist, or capitalistic, which has created a global division among economic powers, highlighting those in decline and those that are successful.At the same time, the first-ever national mobilization of entrepreneurialism, the original American version, was a super success during the last century. Was it a better capitalistic journey? Are they both right and wrong? Something must perform as a global survival strategy.

Entrepreneurial Drive: Entrepreneurialism does not wear a mask, a uniform, a flag, or some wild fight; it is a peaceful march of a person, a solo mystique in search of the unimaginable, striving, struggling, and repeatedly attempting to go beyond the horizon of human endeavor. If you can see, touch, hear, taste, or feel anything extraordinary around you, it was only conceived, developed, and commercialized by an entrepreneur. No great ideas or the world's largest enterprises were ever hatched inside a chicken farm; the entrepreneur created each as a tiny, unknown little shack and carved history.

Facts:

Global Applicability: Entrepreneurial behavior is capitalistic at best. It is still capable of breathing communism or socialism, as controlled economy nations do; they have their versions of entrepreneurship. Nevertheless, entrepreneurship is neither driven by an ideology nor a particular dogma. Entrepreneurial mysticism is very different. It is a unique passion with exceptional willpower, immune to risks and failures, often challenging current methodologies, creating unseen problems, and finding unseen solutions—like playing in a sandbox without any stress. It is a natural behavior to achieve extraordinary success on an impossible journey. Historically, such rags-to-nobility have always resulted in exceptional results, great rewards, and profits, leading to entrepreneurs' accumulation of extraordinary wealth. However, this wealth is not the primary goal.

Realities:

Entrepreneurial Universality
Entrepreneurs do not start with a scheme to make quick money, nor do they crave cash for a lavish lifestyle. A study of the last 100 super entrepreneurs worldwide would prove that. Entrepreneurialism is a global phenomenon that embraces color, culture, race, and religion. It is a natural, original, personalized, neutral, diverse, tolerant, quality focused, success-driven, and limitless struggle. Entrepreneurs tend to get along well with one another, are highly diverse, and are globally oriented, fostering an entrepreneurial environment that is free from hostility, much like athletes in the Olympics competing against themselves and continually improving their skills.

Leadership Gaps: Some countries are fortunate to have national leadership that deeply understands entrepreneurship and can measure and decipher this hidden treasure. They strategically push their small and medium enterprises toward global maturity and international success, providing valuable models for others to learn from.

A list of around 200 nations worldwide, ranked by "ease of doing business," tells another 200 stories about why they are not in the top or middle but at the bottom, about why they missed the boat and why they are still struggling to catch up on national mobilization of entrepreneurship. Most importantly, when leadership lacks such skills, it becomes impossible for the bureaucracies of the day to adopt corrective measures.

Solutions:

Urgency: New economic thinking must explore the evolving landscape of socialistic entrepreneurialism in China and Asia. We need to engage in in-depth discussions about entrepreneurial mysticism and train senior national teams to adopt small and medium-sized enterprise (SME) thinking within 100 days. By balancing socialistic and capitalistic models, we can drive SME growth to enhance global economic resilience. Our presentations are designed to guide strategies for international trade and commerce. How is the West progressing, and how is China advancing at triple speed? What crucial insights do nations need to be aware of now?

Mastery: Our special workshops offer valuable insights to economists on the concept of entrepreneurial mysticism and its role in promoting SME growth. By mastering hybrid entrepreneurial models, we help align global strategies for sustainable economic progress. We offer various orientations to Cabinet members and senior economic teams, aiming to align stakeholders for long-term competitiveness.

Pillar 16:
Now Alpha Dreamers Shape New Order

Links alpha dreamers to entrepreneurial solutions for debt-laden economies, fostering a global order through youth-driven worldwide innovation and prosperity.

Overview:

Rise of Alpha Dreamers: Why is the emergence of a new world of "alpha dreamers" suddenly so important globally? They are "alpha" because they are the first-ever largest globally aware, universally oriented group on this planet; they are "dreamers" because they express enough consciousness to embrace humankind and are curious enough to dream of a better future. Their potential impact is immense, as they possess some powerful qualities that previous generations never had.

Firstly, they learned geography not from the atlas but from deep immersion in real-living colors on the live Internet. Their daily circumnavigation of the world rationalized all this by finger-walking and web-surfing. They inherited their own culture, origins, and rights. They are comfortable in their own skin and equally color-blind to other skins. They think in global space and take pride in their nationalism. Hence, they will support multilateralism, globalization, and a collaborative future.

Facts:

Secondly, they cannot be fooled all the time; their global connectivity and exposure protect them from fake value manipulation economies, wars, pandemics, or woke cultures designed to divide and create unrest. They witnessed technologically advanced engineering of well-planned hate manufacturing. They watched the systematic downfall of institutions. They observed socio-economic destruction as a wellmanaged art and socio-political tool; therefore, they are far better equipped to figure out how weaponization and politicization of such ideas only hurt all humankind. They will openly fight such shenanigans.

Demographic Shift: It all began in 2000 with the birth of 140 million babies worldwide. By 2018, they had reached voting age. Today, at 24, they stand on the cusp of a new era. In the next 2,000 days, as we approach 2030, they will turn 30. They will be joined by 1.5 billion younger voters who have come of voting age in the last 30 years. This collective will form the largest, most interconnected, and globally aware society in the history of civilizations. They are the children of 2000 and, in time, poised to shape our world.

Children of 2000: Centuries ago, by the time a person acquired "worldly knowledge," it was just about time to die. Today, teenagers worldwide have access to vast knowledge, thanks to the Internet, which is arguably the most significant invention ever and one of the greatest gifts from the USA to the world. This technological marvel has shaped the knowledge and understanding of entire generations worldwide.

Realities:

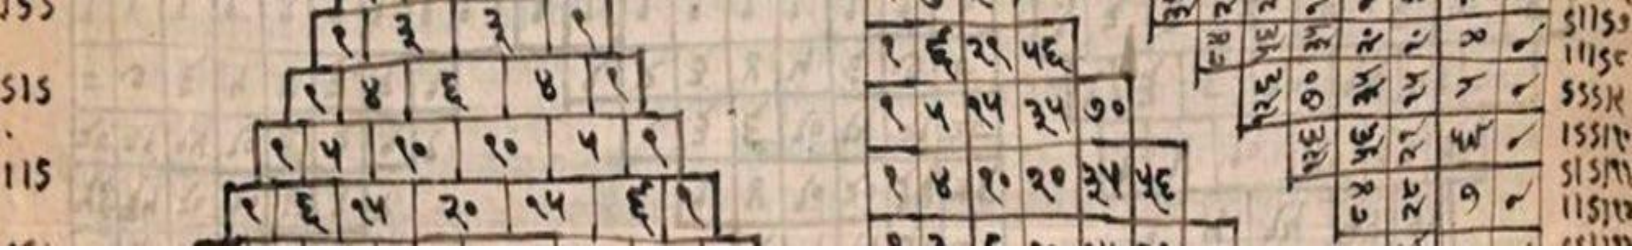
Resistance to Manipulation: They will openly fight such shenanigans. Thirdly, they are the most worldly and knowledgeable people who have ever assembled at the right age and at the right time together in our world. They will finally break apart the dysfunctionalities and reassemble into a brand-new, collaborative world order. They are the alpha dreamers, and possibly, are you one of them, too? Out there exists a clear vision of humankind and the common good. Currently, all such is abandoned in pursuit of a seek-and-destroy mentality.

Need for New Skills: Nevertheless, it takes special skills to decipher these significant challenges, diffuse and triangulate such technocalamities with entrepreneurialism, and create new economic uplifts. But how, why, and who will lead such thinking in each nation? The Gutenberg Press revolutionized the dissemination of printed text and its distributed dialogue and narratives, igniting a revolution of the mind that sought better answers. Humankind awakens now and then.

Solutions:

Urgency: How will alpha dreamers change the world, and what steps will they take to achieve this? National economic teams must implement a specialized agenda within 100 days to measure progress nationwide and enhance understaning. By leveraging the global connectivity of alpha dreamers, we can encourage youth-driven innovation aimed at transforming economic structures. We will outline various stages that provide clarity and depth, demonstrating how this approach will lead to improved programs.

Mastery: The mastery of alpha dreamers represents a new blend of art and science. The Cabinet needs an in-depth understanding, while national trade centers require a certain level of skill. Our narratives are designed to inspire new economic thinking that drives future-focused innovation. By empowering globally aware youth, we can master new economic paradigms that promote collaborative global prosperity. Additionally, we provide orientations intended to align stakeholders for long-term global progress.



Pillar 17: Entrepreneurial Reshaping Global Order

Investigate entrepreneurial-driven global shifts that counter debt, redefining the economic landscape with innovative strategies for sustainable prosperity and growth.

Overview:

The Symphonia of Hyper-competency: The digital age is a hyper-competency dance of meritocracy on the global stage of competitiveness. A small number of national leaders are aware of such developments Today, intertwined digital highways pushing streams, rivers, and oceans of live data are spinning economies into fading blurs, their live depiction of conveyor belts of goods and services demanding unrelenting precision and command. Only new, advanced thinking has a chance to keep a nation in the race as we advance, as anything that resembles old thinking, deeply stuck in sluggish dysfunctionalities, will visibly decline the country on the fast track.

The Decline of Empires Is at Play: Western economies are immune to sluggish performances and are visibly falling behind. The United States is now fighting what can be described as losing wars. Unless regimented around-the-clock wartime speed and authoritative rules are applied, Western nations will dangle and remain complacent for historians to write chapters on causes. Regardless, dynasties never simply die; they are only killed by their own citizens. Since the dawn of the third millennium, what this quarter century has shown us, four silent transformations have rewritten the rules of the existence of economic order: First, trust in global and national institutions has shattered like fragile glass.

Facts:

Global Transformations: Second, education, once a beacon, has crumbled into irrelevance. Third, artificial intelligence has emerged, reshaping human intellect into a sharp edge to manage global hyper-tensions in commerce. Fourth, a new international voice is emerging, still inaudible to most national leaders of Western economies, as mindsets are not correctly aligned to receive the right signals and decipher the real messages.

The Rise of Zentheon: For the first time in millennia, Zentheon has emerged as a phenomenon in which extraordinary numbers of minds, floating around the world on the boundless waves of live, interactive bandwidth on social media, unite across borders, giving three-dimensional form to visionary ideas.

Universal Mindshare: Explained as universal mindshare to define humankind's problems and seek humankind's solutions. In humankind's history, such a large global mindshare in live interactive modes never existed. As proof, when nations become mesmerized and fully intoxicated by their own success, they are later shocked to learn that the global opinion about them is precisely the opposite. The Zentheon, like the rise of a primal voice of humankind, thunders louder than any flag, border, or throne and now advances a new global voice of order.

Realities:

Need for Meritocracy: To compete globally, nations need meritocracy within their bureaucracies and well-audited, innovative thinking that incorporates global perspectives to finally appreciate the powers of grassroots prosperity and bring productivity to the frontline. This alone makes the extended visit and deep study of China a prerequisite. As the rise of restless citizenry continues, proving massive dissatisfaction with broken-down systems, rightism movements will threaten under-skilled societies. Discover an integral national agenda, define and advance a march under the flag of meritocracy with the rule of law, and become a remarkable nation under the rules of human kind and the common good.

The Zentheon and Hyper-Competency Dance: The most striking feature of the narrative is its introduction of the "Zentheon," a groundbreaking concept that describes a borderless, collective mindshare enabled by digital connectivity. Unlike traditional narratives of globalization, the Zentheon portrays a unified human intellect that transcends borders to address universal challenges.

This humanistic perspective frames global collaboration as the "primal voice of humankind," offering a philosophical reimagining of international unity that departs from purely economic or geopolitical analyses. The misleading national opinions: By critiquing nations' fixation on domestic opinion, a blind spot that distorts global perceptions, the draft provides a fresh commentary on insularity, urging leaders to listen to this emerging global consciousness.

Solutions:

Urgency: Once, no one knew what "software" or "hardware" meant, and suddenly, these concepts became the driving forces behind global trade and commerce. We can develop strategies for the nation and economic teams in response to the emergence of Zentheon, training 200 national teams to mobilize program planning within 100 days. Zentheon global influence drives entrepreneurial shifts, countering debt through innovative economic frameworks. Our long-term guidance will help manage strategies for international influence.

Mastery: Such an advanced topic demands specialized skills, and as these skills develop, they differentiate national economic performances. Our specialized workshops will equip Cabinet members and senior frontline teams with a deeper understanding of the rise of Zentheon and its impact on economic growth and innovation. By mastering borderless collaboration, we align global consciousness for sustainable economic transformation. The new art and science lie in comprehending global public opinion and mastering emerging trends.

Pillar 18:
AI: The First Industrial Revolution of the Mind

Explores AI's role in entrepreneurial economies, reducing debt reliance through innovation and driving a transformative industrial revolution by 2030.

Overview:

Mental Evolution: Condense the last millennium into ten minutes and observe how humankind has slowly evolved its mind, the ultimate driver of human progress. Notice in the previous minute how agro-industrial minds suddenly transformed into techno-digitized wizardry with global commerce minds. That last minute's crisscross international communication was 1,000 times greater than all the communications during the previous nine minutes combined. So, what does this mean? Today, humankind has a freshly enlightened mind: it advances only when multiple factors collide every few centuries.

AI Revolution: When the global populace suddenly begins to intuitively believe in its ability to process complex issues more easily, it transforms into an intellectual revolution that cannot be reversed. Once you learn to ride a bike, you will always know how to ride, and hence, you are aware of your talents. This will be the first time in civilization's history that, like the First Industrial Revolution of Mind, the largest number ever, in billions, is far more enlightened and will suddenly change their economic behavior in a globally synchronized fashion.

Rate of progress with AI: A new global consciousness will emerge with AI, utilizing the mind as a unique device to drive growth and prosperity, not just physical activity, as superior automation takes care of all this.

Facts:

Global Uplift
This will create a global uplift, as a billion brighter thinking minds suddenly join the international unoccupied populace, inclined to seek new authoritative skills in developing new international standards for entrepreneurial thinking. Hunter-gatherers were entrepreneurial. As proof, they abandoned their square contraptions, adopted the wheel, and emerged from the caves. We have an identical combination all over again. Our new world is about the mind and its hidden powers as the most incredible economic development asset; this is where over 100 countries have been let down by economic intellectualism, infested with theorems and charts, and out-of-focus political punditry.

AI's Economic Impact:
Today, not national debt but pragmatic and better solutions will save the world. This is where the next global revolution lies hidden. Here, the First Industrial Revolution of the Mind will emerge, making significant changes across free-market economies and helping them break free from constraints. As a global tidal wave, AI will change global landscapes like jet planes or automobiles, and international e-commerce has already shown this.

Humankind's Invention: Is AI the missing fulcrum so critically needed to move the earth? Is it key to opening humankind's hearts and minds to knowledge, hidden talents, hobbies, and gutsy options to kindle entrepreneurial journeys?

Realities:

Mental Resilience: Is it that pathway where, for the common populace, the barefoot heavenly messengers talked about self-discovery and self-reliance? Will this super-techno force of AI help prepare the mind for more risk-taking, superior mental performance, entrepreneurial productivity, and grassroots profitability in new national economic measures? Only nations that can declare national mandates to uplift and upskill their citizens in an AI-centric world and deploy national mobilization of entrepreneurialism will have a significant visible advantage in the competitive global landscape.

AI-Centric Future: How else will the nation become a magnet to attract international foreign investments and special events? As we advance into the future, economic growth is no longer hidden within economic theorems; it is now hidden as a national treasure alongside the national mobilization of entrepreneurialism and AI deployments. No amount of wealth, whether in gold or diamonds, can ensure regional prosperity. It will be a mentally prepared national citizenry, ready for advanced productivity, with highly motivated mobilization, and equipped with the necessary skill sets to work alongside AI-centricity.

Adjust your clocks, measure your mental capacities, and behold the power of superior programming branded artificial intelligence. AI is about to fortify the First Industrial Revolution of Mind, as it will take over almost all "work" currently handled by the global workforces, nation by nation, thereby relieving and liberating workforces to find other more suitable and creative mental challenges.

Solutions:

Urgency: Artificial intelligence (AI) is set to eliminate a billion jobs, but it will also create a billion highly skilled positions. This change is inevitable, so it's essential to make an informed choice. We offer strategies for navigating the AI revolution by training 150 national teams over 100 days on specific planning. AI-driven entrepreneurial ecosystems spark mental revolutions, leading to global prosperity.

Mastery: The world is shifting from being "muscle-driven" to "mind-driven." Therefore, understanding "entrepreneurial mysticism" has become a key topic in the AI era. Our Cabinet-level workshop provides an authoritative analysis of how entrepreneurial mysticism will enhance the presence of AI. Mastery involves developing the skills needed to navigate AI and drive a highly productive future effectively. By harnessing the transformative power of AI, we can cultivate entrepreneurial economies that enhance global competitiveness. We help teams anticipate future changes and adjust accordingly. When depth and maturity are achieved, there is no cause for panic. Artificial intelligence is artificial ignorance.

Pillar 19:
Why Nationalize Artificial Intelligence?

Examines how AI will replace and create a billion jobs, advocating the nationalization of AI to harness entrepreneurial mysticism for economic growth.

Overview:

AI as a National Asset: Why not lead the first industrial revolution of the mind, create entrepreneurial nations, and nationalize AI as a national asset for the citizens? The reality: Excessive digitization only creates dry digital deserts. Across 100 free economies, oceans of small and medium-sized enterprises (SMEs) are filled with millions of abstract entrepreneurial ideas, fostering living, breathing, and dynamic economies.

Entrepreneurial Necessity: Economic theorists cannot find any other source for creating large enterprises without these oceans of SMEs. The long-awaited 4th Industrial Revolution is not coming; we have already arrived at the First Industrial Revolution of the Mind.

The Proof: The world's largest enterprises are a testament to history and the impact of such metamorphosis on global commerce. They also demonstrate how economic intellectualism has failed the commerce sector, driven by economic theories while visibly ignoring the national mobilization of entrepreneurialism. The speed: How, why, and under what available expertise can all such be mobilized methodically and systematically? Why will the nationalization of AI save national economies, uplift citizens to new heights, bring direct benefits by aligning with the first industrial revolution of the mind, and create a culture of continued upskilling and reskilling among high-potential national citizens?

Facts:

Human Intelligence: This will foster entrepreneurial economies and ultimately lead to national mobilization of entrepreneurialism, resulting in grassroots prosperity. The human intelligence: Getting results from push-button operations is not a typical test of human intelligence. Humans have already invented the codes to achieve this. The progress on digitization is very high. Floor by floor, we rise in speed and complex quality. Today, we need far more mental resilience and brilliant performances to reach the top floors of super skyscrapers of planning and execution, not necessarily more muscular legs.

Educational Lag: Our education system is visibly decades behind when it comes to pragmatic education, critical thinking, and the required skills and commerce affairs for entrepreneurial economies. The waste: The tragedy lies in the inability of educational thought to continually reinvent, recreate, and relearn itself, thereby preparing the nation for advancements. It has only become a bloated, bureaucratic mess, destroying our children and a visible cause of economic harm. The bureaucracies: Our political leadership no longer kisses babies and shakes hands firmly but pretends to indulge in techno-electoral mazes as an art, often at great cost to the nation. Government administrations across Western economies are unprepared for "AI-centricities" wrath on bureaucracies.

Realities:

AI-Driven Transformation: What is needed is a rigorous orientation to land today's mind a decade ahead for the global stage, allowing the mind to relearn all the new demands backed by human intelligence and organized thinking focused on creating value while transforming all paper-based procedures and hierarchical decision-making into digital systems. The genius: Such moves will eliminate billions of white-collar jobs. Still, the genius is hidden in the parallel mobilization of entrepreneurialism, which aims to channel all displacements into creative and innovative entrepreneurial thinking, something far beyond the realm of current university systems.

Entrepreneurial Focus: The case studies: Why has the academic world been enslaved to case studies? Entrepreneurs do not study and memorize case studies; they burn them. They are the creators of the prime ideas for which the case studies were born. There were no case studies on Uber before it was invented; there were none until desktop computers and mobile phones were commercialized, monetized, and became a global phenomenon. The national mobilization of entrepreneurialism: Entrepreneurs cause tsunamis, and academia follows the footprints and tabulates the shockwaves recorded as the prime guts of the study.

At this stage, like a broom, economic studies collect the debris from the unexplainable dynamism left by entrepreneurialism battling in sandboxes, later formalizing to piece together their original analytical story.

Solutions:

Urgency: When the national administration gets deeply engaged with AI, the focus will shift to the question of when to nationalize AI. How can we effectively manage the nationalization of AI? Our workshops orient 100 to 200 national teams within 100 days. By nationalizing AI as a strategic asset, the nation can empower SMEs to drive sustainable economic growth. Our presentations engage participants ranging from 50 to 500, guiding them in entrepreneurial strategies. Through national mobilization, clients can take control of their prosperity.

Mastery: In a world where AI and talented individuals dictate national productivity, the complexities of performance will pose significant challenges for economists. Our lectures provide valuable insights and limits on AI nationalization, promoting growth driven by SMEs. By mastering AI integration, we transform national economies into entrepreneurial powerhouses that thrive in global markets. We offer orientations to align stakeholders for long-term competitiveness, enabling clients to drive economic progress and achieve global prosperity.

Pillar 20:
How Can Micro-Power Nations Compete with Super-Power Nations?

Explores how micro-power nations can leverage entrepreneurial talent to outsmart larger economies, creating dynamic, SME-driven national economies.

Overview:

Micro-Power Challenges: Calling an SME small, like declaring a baby elephant small, proves a lack of zoology. Laughing at a caterpillar dreaming of flying proves one doesn't know about metamorphosis. Missing, ignoring, and failing to balance with entrepreneurial job-creator mindsets, and not recognizing SMEs as the topsoil from which gigantic global enterprises are born and raised. How can micro-power nations compete with super-power nations? Most micro-power nations are already rich, but in the wrong hands, and hence, poor. Most nations already have extraordinarily talented citizens and sufficient entrepreneurial mindsets to make their country great, but unskilled bureaucracies hinder them and, therefore, struggle with dysfunctional economies.

Global Lessons: What lessons are being offered to the world's free economies, and what options are they leaving for them to deploy? The USA is providing a blueprint for achieving superior performance from bureaucratic organizations; this might become a new chapter in human history on how to save nations from incompetence and abuse of power. Why did the world miss the opportunity? Why was there never a national declaration to fix these bureaucratic issues during the last hundred years, like what Trump's team currently does? Economies around the world are struggling primarily with self-created problems with no solutions in sight. It is now time for each nation to get a chainsaw team of super experts.

Facts:

National Mandate: Making a country great requires a clear national mandate. Achieving exceptional mastery in leading national value creation, productivity, and profitability while fostering a highly skilled citizenry requires a national mobilization mandate. Optimizing all nationally available resources and acquiring specialized skills is essential. Suppose only 1% of your national citizenry can achieve such goals and become the driving force on national performance and can play on the global stage. In that case, the remaining 99% will enjoy cascading residuals and benefits, as well as the extraordinary potential to follow similar paths and achieve increased productivity.

Competency Needs: Such mobilizations will quadruple grassroots prosperity. It is the absence of common sense that has led to the failure of economies. Super-power nations are always in search of high-value goods and services. Hence, competing on price to produce cheaper products against China or India will only destroy your national economy. Everything based on such thinking lies outside traditional education and economic theories; this new global age demands global-age skills and a deep study. International rules of engagement.

Competency scores: As the world advances, competency becomes highly critical. As degrees on the wall fade in color, power, and utility values, the rise of technology forces daily, year-round intense education to stay in the race. As productivity demands are increasingly refined, performance must match astonishing results to avoid failures.

Realities:

Evolving Workspaces: We must rent a time machine; it is essential. Just sliding back a few decades and flying over the downtowns of the world only raises a few questions: Who needed a phone with a 100-yard cable attached? Who needed a cubicle to be chained, and who needed an office anyway? Slide forward just a few decades, and some questions will emerge. Why are so many young yet so advanced and hyper-talented youths running the world's largest and most complex enterprises on digital highways? Who needs corner offices, and who needs bureaucracies anyway? When is the world so interconnected globally, with such a high level of interdependence?

Skill Gaps: Such trips in a time machine will teach us how fast the world is spinning and how deeply asleep our governments are. Let's ring the alarm. Micro-power nations must acquire special skills to discover hidden talents among their citizens. This has been the downfall of both big and small nations. Decades have passed, but skills remain the primary concern in most countries.

Understanding the landscapes: Why is building the nation first and building the country second? Tariff wars, audits, and fraud recovery are significant efforts to reform bureaucracies, but they still cannot significantly improve a nation's productivity, performance, and profitability. The lost decades will remain lost despite a 100% turnaround in building the national citizenry to stand up to the global age of competitiveness.

Solutions:

Urgency: No person or nation is insignificant if their minds are open to tackling larger issues. We must consider how to rediscover the power of micro-nations in this era of global competitiveness. By mobilizing entrepreneurial talent, micro-nations can outsmart super-powers through innovation driven by small and medium-sized enterprises (SMEs). The question is: How can a small nation become an entrepreneurial giant? How can we train 50 to 100 teams nationwide? The Cabinet must adopt a global policy that recognizes the role of digital highways in providing worldwide access and special advantages to micro-power nations.

Mastery: Leaders of micro-power nations need to master various topics and understand the dynamics of the global economy as they navigate its complexities. By mastering entrepreneurial ecosystems, micro-nations can compete globally with innovative, high-value trade strategies. It's essential to consider how quickly teams can become skilled and begin mobilizing national talent.

Pillar 21:
The National Mobilization of Entrepreneurialism
Explains the proven art and science of nation-building on the global stage, and why it is often forbidden by economic intellectualism.

Overview:
The Big Proof: No free economy can become a superpower without the national mobilization of entrepreneurialism. A study of the USA from over a century ago, along with analyses of China and India from a few decades back, illustrates these paths. Now, imagine a dozen other nations adopting Asian standards of nation-building, considering their levels of human productivity, performance, and profitability, as well as the influence of AI. What kind of new global marketplace would this create?

Imagine if the world suddenly decided to outsource its infrastructural needs, such as building fast trains, circular cities, and the necessary bridges, dams, and advanced power grids. Countries like China, with their experience in global initiatives such as the Belt and Road Initiative (BRI), could potentially double their GDP and generate trillions of dollars. It takes a job creator's mindset to envision these possibilities and a job seeker's mindset to calculate the steps needed to bring them to fruition.

The National Administration & Mobilization of Entrepreneurialism (NAME) is designed to systematically uncover and upskill hidden entrepreneurial talent through live interactions, which are integrated with small and medium-sized enterprises (SMEs). The entrepreneurial solutions, guidance, and discussions offered by entrepreneurial minds are not merely ideas; they are potential game changers that could transform the landscape of over 100 free economies.

Facts:

In Search of Mindsets: Gemologists need to distinguish diamonds from broken glass; SMEs are often seen as small, to the unmatched mindsets still lacking the required vision. In fact, SMEs, like tadpoles paddling in their oceans, are, in reality, Godzilla-sized operations, slowly growing. The USA established its global image as a superpower by becoming the world's largest agro-industrial nation long before economic theories were widely popularized.

Political economy is like ice hockey played on football fields without ice or hockey sticks but with tennis rackets under volleyball rules.

Global Goals: The circular confusion, spinning more short-term branding. Now, it becomes crucial that we assess the top 100 major economic events across the free economies during the last year. Study the contents, check the profiles of speakers, and read the final deliberations. The future is about to score something, but in which direction and under what rules, like an abstract painting, just too abstract, without a canvas, painted but with no brush or paint.

Realities:

This is a battle, a movement for conquest aimed at uplifting the talents of humankind. The most visible damage can be seen in the lost generations within over 100 free economies that are unable to keep pace with the global age of competitiveness.

The leadership for a national mobilization of entrepreneurialism calls for recognizing the hidden treasures of human talent, capable of reaching great heights but often overlooked by economic development teams who believe their potential has already been fully realized. The motivation to uplift our citizens and recognize the mystique of entrepreneurialism requires bold courage to streamline and advance grassroots prosperity on a national scale. This will pave the way for us to thrive on global digital highways once we achieve our goals.

Time for New Triangulations of the Nouveau Rationalizations: As visible storms of chaos and confusion emerge, it is essential to isolate and clarify key patterns. Innovative thinking can lead to new insights and calls for focused solutions and actionable strategies, such as:

Economic Intellectualism vs. Entrepreneurial Mysticism

Numerical Theorization vs. Mindset Optimization

The Size of Enterprise Sectors and the Matching Corresponding Mindsets

National Administration and the Mobilization of Entrepreneurialism

Solutions:

Urgency: To uplift 50% of high-potential SMEs across the nation is a major task. Initial planning in 100 days and orientations of 100–1,000, plus a positive dialogue with 1,000 to 50,000 SMEs, is a formidable achievement. To address these challenges, a range of national reorientation programs tailored to each country's rapid transformation is now available at the Cabinet level. "National Mobilization of Entrepreneurialism" is a robust solution to the global job crisis.

This is largely due to the lack of visible skills crossing political boundaries, were economic intellectualism rides unicycles of theorems, juggling inconsistencies in economic growth, in reality, a big circus in a spin.

Mastery: Henry Ford was an innovator who, although he did not invent the tire or the car engine, revolutionized manufacturing with the assembly line. Similarly, Expothon, a catalyst for change, did not create small and medium-sized enterprises (SMEs) or the concept of exportability, but it ignited the idea of "national mobilization of entrepreneurialism." This concept represents a highly efficient, round-the-clock SME upskilling operation that is now gaining international recognition, highlighting its potential to enhance the SME sectors of nations and drive dynamic economic growth. Its global acknowledgment is a source of pride and reassurance. A series of special workshops and orientation of all national teams, trade groups, and chambers on mobilization will create a vibrant start. For more information, explore further on Google.

Expothon & National Mobilization of Entrepreneurialism

Why is Expothon gaining attention? During a decade-long campaign that highlights the shortcomings of academic economic theories Expothon has provided critical analysis and solutions to global economic issues. Weekly narratives and globally published articles from Expothon have reached over 2,000 cabinet-level officials across 100 countries for the last 50–100 weeks, facilitating a worldwide shift toward practical solutions for small and medium-sized enterprises (SMEs) in regions such as the GCC, OIC, EU, AU, Commonwealth, BRICS, and ASEAN.

This track record of expertise and trust is the foundation of our proposed strategies.
The step-by-step application of well-defined and proven methodologies helped create a comprehensive national agenda for upskilling exporters, reskilling manufacturers, and mobilizing high-potential SMEs across the nation.

Global Hub: Currently, Expothon is developing an international hub to provide large-scale senior-level guidance to selected 100 free economies and blocs like GCC, OIC, European Union, African Union, ASEAN Commonwealth, and BRICS. This initiative aims to enhance the 'National mobilization Entrepreneurship' by offering nation-specific, customized deployment solutions. The Global Hub, fully equipped and prepared, will deploy 1000 experts with global digital accessibility to guide some 50-100 countries on managing their national SME base, upskilling exporters, and reskilling manufacturers.

A Decade-Long Quest to Combat Economic Incompetence

The Origins of a Revolutionary: Naseem Javed was born in India to a family of small merchants with roots tracing back centuries to Delhi's Chandni Chowk. He received his education in Karachi and moved to Canada fifty years ago. His formative experiences at the 1976 Montreal Summer Olympics taught him how to establish organizations with a global presence. During the past 25 years, Javed advised the top senior management of Fortune 500 companies on mastering the commercialization of complex ideas. In 2000, disillusioned by the market's transition from value creation to manipulation—where factories valued at $1 million were trading for $100 million on stock exchanges—he took a sabbatical. During this time, he committed himself to supporting the uplifting and reskilling of the world's 100 million small and medium-sized enterprises (SMEs) at minimal cost.

The Curiosity: Over the past few years, his LinkedIn profile has consistently attracted visits from top global institutions, amounting to several thousand visits each year.

The Architect: Javed has spent over a decade developing the National Mobilization of Entrepreneurialism Protocols while serving as Chair of Expothon Worldwide. Now packaged for global markets, as the "National Administration & Mobilization of Entrepreneurialism (NAME)," His work challenges the shortcomings of traditional economic theories. As a corporate philosopher, he views small and medium-sized enterprises (SMEs) as essential to reviving struggling economies. He criticizes the prevalent mindset of job seekers, who make up 99% of those engaged in current free economies, without balancing the mindsets of job creators. He has split the atom of economic intellectualism on this point, as directly responsible for the continuous decline of Western economies, while China has set proper examples.

Javed is a world-class speaker who has been invited to over 100 major events worldwide. A proposed global summit aims to unite leaders in prioritizing job creators, breaking free from bureaucratic constraints, and fostering entrepreneurial economies. Javed's vision—rooted in risk, innovation, and small and medium-sized enterprises (SMEs)—provides a blueprint to avert economic collapse and redefine prosperity for 100 free economies.
